SAP NetWeaver "How-to" Guides are intended to simplify the product implementation. While specific product features and procedures typically are explained in a practical business context, it is not implied that those features and procedures are the only approach in solving a specific business problem using SAP NetWeaver. Should you wish to receive additional information, clarification or support, please refer to SAP Consulting.

Any software coding and/or code lines / strings ("Code") included in this documentation are only examples and are not intended to be used in a productive system environment. The Code is only intended better explain and visualize the syntax and phrasing rules of certain coding. SAP does not warrant the correctness and completeness of the Code given herein, and SAP shall not be liable for errors or damages caused by the usage of the Code, except if such damages were caused by SAP intentionally or grossly negligent.

# 1 Business Scenario

You want to incorporate functionality in a process chain that is not provided by the delivered process types. You can implement the needed functionality as an ABAP/4 program and do not need a customer defined process type. For customer defined process types please refer to the documentation of process chains.

This document describes the steps to incorporate an ABAP/4 program into a process chain. The used example of deleting and recreating an existing secondary index of an ODS object can be exchanged by any other example. The sample program does not claim to be complete or correct.

## 2 The Step By Step Solution

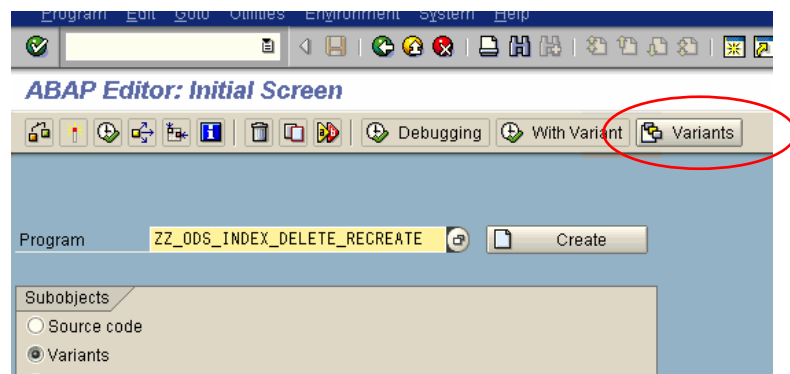

The required functionality is implemented as an ABAP/4 program. The program is incorporated in the process chain with the process type 'ABAP program' and the creation of a respective variant for the program (if needed for the population of selection parameters for the program).

The screen shots are taken from a BW 3.0B, Support Package 13, system.

### 1. Create an ABAP program

Use transaction SE38 to implement your ABAP/4 program. Please see the [Appendix](#) for a sample source code of the sample program.

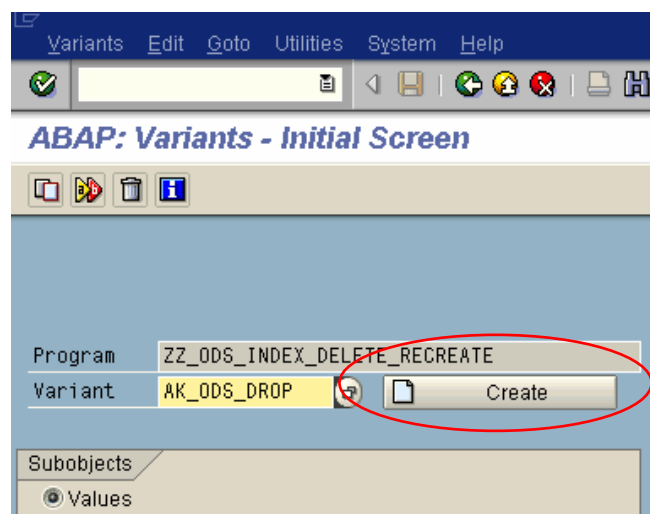

If the program has selection parameters, you have to define a variant for the execution of the program.

### 2. Creation of a variant

a). Provide a name for the variant, and populate the parameter fields with the desired values.

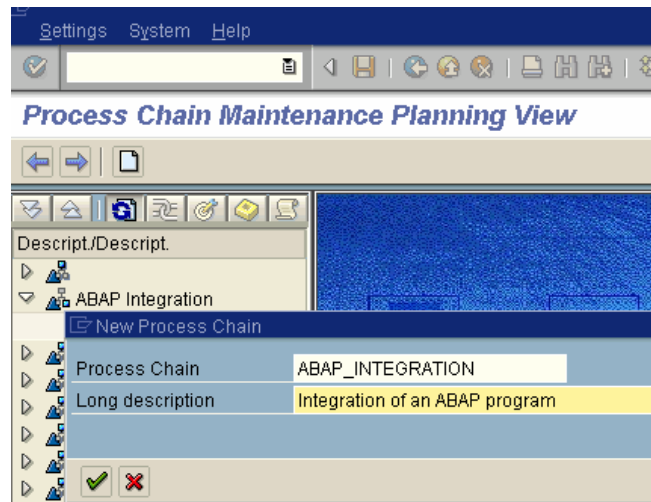

b). The attribute screen allows you to provide a description for the variant and to specify settings for the selection parameters of the program.

### 3. Definition of a process chain

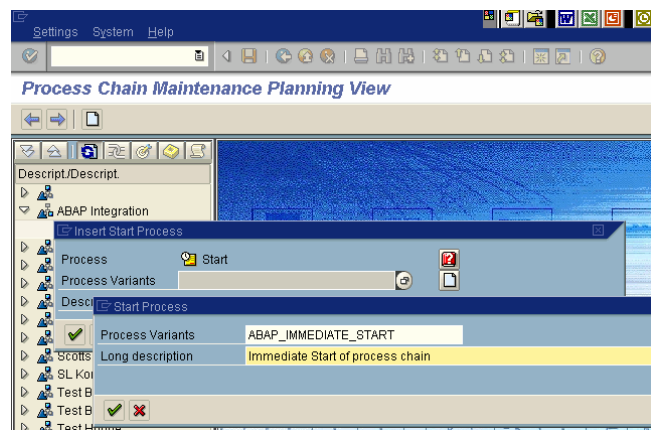

Press the respective icon in the Administrator Workbench (🔗) or use the transaction RSPC. Create a new process chain, and provide a title and a description.

NOTE: If you want to assign your process chain to a specific or new 'display grouping', you can do so by pressing the 🧑 icon.

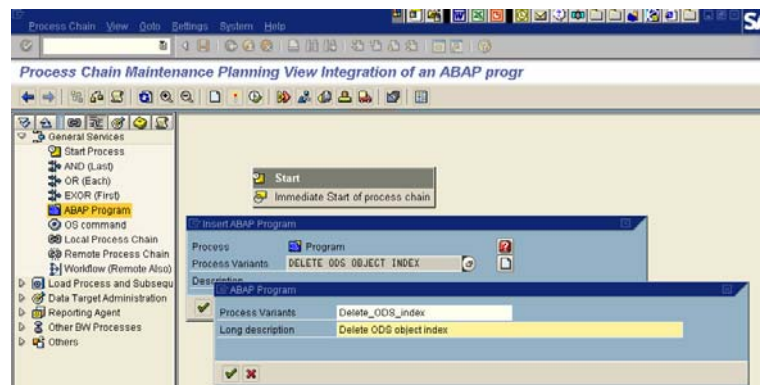

### 4. Assignment of a variant to the start process

Every process chain needs a start process with a variant, which specifies the scheduling parameters of the process chain. Create either a new variant or re-use one of the already existing ones.

### 5. Inclusion of the ABAP/4 program

After you have created the variant for the start process, include the ABAP/4 program as the next process type. You have to create a new variant for the process type or re-use an existing one.

## 6. Specification of program settings

You specify the program to be run and the variant that the program should use (in case the program has selection parameters). The other settings are the same as for the background scheduling of any ABAP/4 program. For further information about those, please refer to the documentation of the ABAP/4 Workbench.

**Note** If you use the Call Mode 'Asynchronous', you have to the function module RSPC\_ABAP\_FINISH in your program to indicate the completion of your process.

Variant: DELETE\_ODS\_INDEX (Delete ODS object index)

Last Changed On: From KEPLERA, On 11.06.2003 At 11:31:56

Call Mode: ☒ Synchronous, ☐ Asynchronous

Called From: ☒ Local, ☐ Destination

Program to Call: ☒ Program, ☐ Scheduled Program

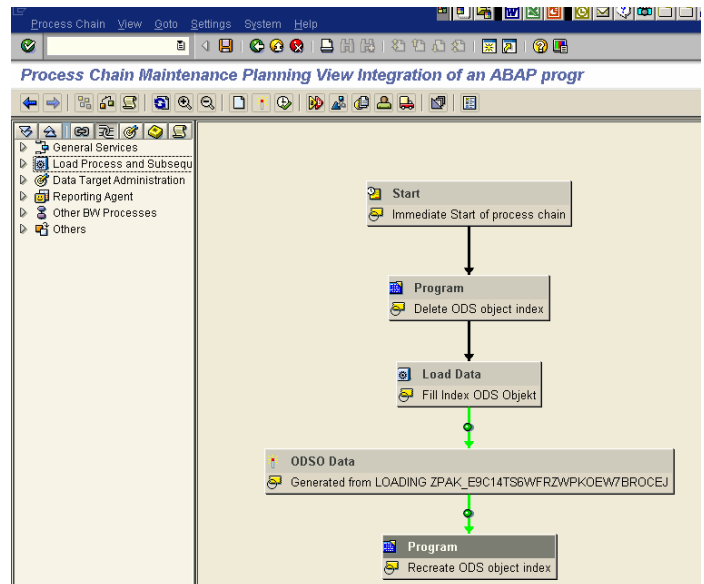

Program Name: ZZ\_ODS\_INDEX\_DELETE\_RECREATE

Program Variant: AK\_ODS\_DROP

## 7. Complete the process chain

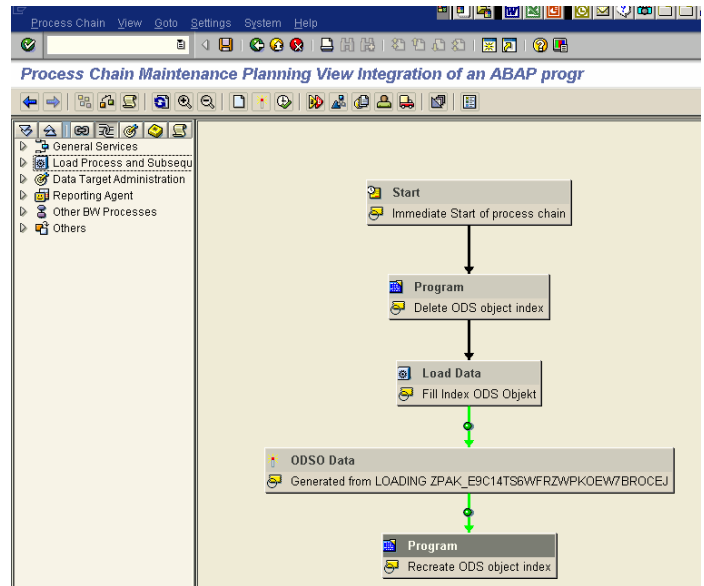

Complete the process chain as needed. The sample process chain shows the following processes:

- Delete ODS object indexes
- Load data into ODS object
- Activate data of ODS object
- Recreate ODS object indexes (only if the activation of the data was successful)

## 8. Activate and execute the process chain

In order to execute the process chain, you have to activate it , and afterwards schedule it . The scheduling triggers also an automatic activation of the process chain.

## 3 Appendix

Sample code for an ABAP/4 program to delete and recreate the indexes of an ODS object from the database. It does not delete the indexes from the ODS object maintenance.

```
*&-----*
*& Report ZZAK_ODS_INDEX_DELETE
*&
*&-----*
*&
*&
*&-----*
```

REPORT ZZAK\_ODS\_INDEX\_DELETE .

PARAMETERS: P\_ODS TYPE RSDODSOBJECT, "Name of the ODS Object  
p\_mode. "Call mode of program

Case P\_mode.

when 'D'.

\* Delete index of ODS Object

CALL FUNCTION 'RSSM\_PROCESS\_ODS\_DROP\_INDEXES'

EXPORTING

I\_ODS = P\_ODS.

when 'C'.

\* Recreate indexes of ODS Object

CALL FUNCTION 'RSSM\_PROCESS\_ODS\_CREA\_INDEXES'

EXPORTING

I\_ODS = P\_ODS.

endcase.
